

## **AUSSIE GMP PUMPS** HYDRAULIC DRIVE (CORROSION RESISTANT) ... 3 YEAR PUMP WARRANTY

B2KQ-A/B

Features

- Elimination of independent engine in mobile » applications
- Compact design
- Power supplied by hydraulic lines
- Self priming vertical lift of 6 metres
- Range of materials for construction
- Replaceable suction port
- Mechanical seal in range of carbon ceramic, silicon carbide or tungsten carbide (option)
- All pumps pedestal mounted
- Drive shafts available in high grade steel or stainless steel configurations
- Viton seals option
- **Specifications**

### Aussie GMP cast 316 stainless steel and NiAl bronze hydraulic drive pumps are ideal for mobile, corrosive applications.

They provide loads of power and real design flexibility. The range includes models with 2", 3" and 4" ports. Flows available to 2200 litres per minute and heads to 31 metres.

### Benefits

- Reduced cost
- Facilitates installation »
- Flexible design, elimination of drive » shafts
- Ready to pump in minimum amount of » time
- Can be specified to suit specific » applications
- Easy to change if thread damaged, easy » access to check valve
- Suitable for a wide range of applications »
- Makes installation simple »
- Applicable to specific models »
- For corrosive applications like AdBlue & » chemical transfer

### These hydraulic drive motor pumps can be operated in either closed centre or open centre hydraulic systems.

### **Applications:**

- Mine and dust suppression
- Water cart
- Water deliver truck tanker
- Fire fighting tanker refill
- Underground mine dewatering
- Bilge pump out
- Deck wash down
- Tank aeration
- Fire fighting
- AdBlue transfer

#### **Rejuvenation kits...**

T

Contain gaskets, mech seal, counterface & complete check valve to make servicing these pumps a breeze.

### HYDRAULIC MOTOR DRIVEN PUMP APPLICATION INSTRUCTIONS

### **HYDRAULIC SYSTEM REQUIREMENTS:**

The hydraulic motor driven pump can be operated on either a The pump hydraulic motor has a BUILT-IN BYPASS VALVE to control the closed centre or open centre hydraulic system. The maximum system requirement is 31 litres per minute of hydraulic fluid flow for models up to and including B3KQA/ST units. The system requirement for the larger units is 66 litres per minute. Flows less than or greater than this may result in a lower pump speed, lower pump output, and lower pressure delivered by the pump. Flows exceeding these levels may damage the hydraulic motor and the pumps.

### CLOSED CENTRE VERSUS OPEN CENTRE HYDRAULIC SYSTEMS:

An OPEN CENTRE hydraulic system is based on either a vane or gear type hydraulic pump. These pumps have a constant output proportional to the speed of the engine driving them. When this flow is not being used, a valve diverts the flow back to the hydraulic reservoir where it is recirculated through the pump. The term "open centre" is derived from the type of valve used to control an open centre system. The open centre position of the hydraulic valve permits the flow of hydraulic fluid back to the reservoir in the neutral position.

A CLOSED CENTRE system uses a variable displacement piston pump. This type of pump varies its output from zero flow to maximum flow depending on the demands put to it by the system. All this happens without disengaging or changing the speed of the engine driving the pump. The term "closed centre" comes from the fact that the type of valve used to control this system completely shuts off the flow in the neutral position.

### INSTALLATION OF PUMP ON AN OPEN CENTRE SYSTEM:

amount of oil flowing through the motor, thus controlling the RPM of the motor. After determining that your hydraulic power supply meets the minimum hydraulic fluid flow, the supply line from the hydraulic pump or control valve should be connected to the inlet port of the hydraulic motor. The outlet port should be connected to return to the hydraulic system reservoir. Before starting up the system, the bypass valve should be opened far enough to ensure that the motor will not overspeed. To do this, loosen the locking nut on the bypass valve. Close the bypass valve by turning the screw clockwise until it seats. Then turn it out about three full turns.

With the hydraulic motor bypass valve open, the speed of the motor will be slow. Close the bypass valve slowly by turning it clockwise until the pump starts pumping. This should be done with the pump discharge valve open. Once the pump is pumping liquid, the discharge valve can be closed. At this point, the pump should not be developing very much pressure. This is an indication that the pump is not yet up to full speed. To get maximum pump performance, slowly close the motor bypass valve by turning it clockwise.

L

### **Optional Accessories:**

- Heavy duty galvanised roll frame (standard on diesel drive )
- Heavy duty suction hoses 2" and 3"
- Medium pressure lay flat delivery hose, working pressure 100 psi
- High flow diesel transfer fuel nozzle
- Carbon ceramic, silicon carbide, tungsten carbide or Viton seals available

Due to our program of continuous product development the manufacturer reserves the right to alter specifications without notice. L
